

The Life and Death Team Project

Part III. (Week 9 Lab)

The Query Engine Code and Data Organization

In this week's lab and for the following week, you will be preparing the following deliverable (to be documented and stored on Trello):

1. Perl scripts to pre-process all of your data.
2. A description of the organization of the data (directory and file structures).
3. A description of how the user is to interface with your system (i.e. how do you ask your system a question?).
4. Perl scripts to answer at least one of your questions.
5. Perl scripts to produce at least one visualization that is NOT the same as the code given to you on CourseLink.

This is due on **at the end of Lab 10**. Please make the documents and code easy to find on your Trello site. The documents should be downloadable as **Word** or **PDF** files.

You might not be able to accomplish all of these tasks. Please put these tasks on your Scrum Board (in the ToDo or Backlog column) and document what you accomplished during this Sprint. Unfinished tasks will have to be done in your next Sprint and this plan should be documented on your Trello site to explain why all of the tasks were not accomplished in this Sprint.
